CITATION: Stoughton, T.L. 2005. Technical AE0317309: A Subacute Dietary LC<sub>50</sub> with Mallards. Unpublished study performed by Bayer Corporation, Agriculture Division, Research and Development Department, Environmental Research and Toxicology, Stilwell, Kansas. Study No. A9720801/EBAIM003. Study sponsored by Bayer CropScience, Research Triangle Park, NC. The final report issued October 14, 2005.

**DISCLAIMER:** This document provides guidance for EPA and PMRA reviewers on how to complete a data evaluation record after reviewing a scientific study concerning the acute dietary toxicity of a pesticide to avian species. It is not intended to prescribe conditions to any external party for conducting this study nor to establish absolute criteria regarding the assessment of whether the study is scientifically sound and whether the study satisfies any applicable data requirements. Reviewers are expected to review and to determine for each study, on a case-bycase basis, whether it is scientifically sound and provides sufficient information to satisfy applicable data requirements. Studies that fail to meet any of the conditions may be accepted, if appropriate; similarly, studies that

PMRA Submission Number 2006-2445

**EPA MRID Number 468017-31** 

meet all of the conditions may be rejected, if appropriate. In sum, the reviewer is to take into account the totality of factors related to the test methodology and results in determining the acceptability of the study.

PMRA Submission Number 2006-2445

EPA MRID Number 468017-31

# **EXECUTIVE SUMMARY:**

The acute dietary toxicity of Pyrasulfotole to 10-day old Mallards, Anas platyrhychos, was assessed over 8 days (5 days on treated feed and 3 day recovery period). Pyrasulfotole was administered to the birds in the diet at mean measured concentrations of 306, 605, 1275, 2657, and 5089 mg a.i./kg dw of diet (75, 143, 280, 597, and 1,067 mg a.i./kg bw daily dietary dose, respectively). The acute dietary  $LC_{50}$  was >5089 mg ai/kg diet. The NOAEC was 5089 mg a.i./kg diet. According to the US EPA classification, Pyrasulfotole would be classified as practically non-toxic to Mallards on an acute dietary basis.

There were no mortalities in the control or treatment groups. No treatment-related clinical signs of toxicity were observed during the study. There were no adverse effects on body weights or feed consumption during the exposure portion of the study. During the recovery period, there were statistically significant reductions in body weight gain (68-88%) at the 605, 1275, and 2657 mg a.i./kg diet treatment levels, but not the highest treatment level (5089 mg a.i./kg diet). Furthermore, there were no statistically significant differences in the body weight of the different treatment groups at the study termination. Therefore, the observed reduction in growth rate for the middle three treatment levels during the recovery period was not thought to adversely affect mallard growth.

Additionally, several birds in the 605, 1275, 2657, and 5089 treatment groups, after being necropsied, had visible yolk stalk diverticulums. The study author considered this a normal finding for mallards, however, the potential biological significance of this finding is unknown.

This toxicity study is classified as ACCEPTABLE, is scientifically sound, and does satisfy the guideline requirement for an acute dietary toxicity study with mallard ducks.

# **Results Synopsis**

Test Organism Size/Age (Mean Weight): 10 days old, 155.0-163.4 g (treatment means), 136.8-172.3 g (range)

 $LC_{50}$ : >5089 mg ai/kg diet

95% C.I.: N/A

NOAEC: 5089 mg a.i./kg diet

Probit Slope: Not calculable

95% C.I.: N/A

Endpoint(s) affected: None

# I. MATERIALS AND METHODS

**GUIDELINE FOLLOWED:** 

This study was based on procedures of EPA 71-2, OPPTS 850.2200 and OECD Guideline No. 205. The following deviations from U.S. Environmental Protection Agency Series 850-Ecological Effects Test Guidelines (*draft*), OPPTS Number 850.2200, *Avian dietary toxicity test* 

were noted:

No deviations were noted.

**COMPLIANCE:** 

Signed and dated GLP, Quality Assurance and No Data Confidentiality statements were provided. The test was conducted according to the US EPA-FIFRA Good

Laboratory Practice (40 CFR Part 160).

A. MATERIALS:

1. Test Material

Pyrasulfotole (AE 0317309)

**Description:** 

Light brown powder

Lot No./Batch No.:

OP 1-4

**Purity:** 

95.4%

**Stability of Compound** 

**Under Test Conditions:** 

Stability of the test material was determined in the 313 and 5000 mg a.i./kg

feed after one day. The recoveries were 96-97% of the initial concentrations.

Storage Conditions of

Test Chemicals:

Stored under ambient conditions.

PMRA Submission Number 2006-2445

EPA MRID Number 468017-31

# 2. Observations:

**Table 2: Observations** 

| Parameters  | Details  | Remarks   |
|---|--|---|
| Parameters measured<br>(mortality/body weight/<br>mean feed consumption/<br>others) | <ul> <li>Mortality</li> <li>Clinical signs of toxicity</li> <li>Mean feed consumption</li> <li>(g/bird/day)</li> <li>Mean body weight</li> </ul>   |   |
| Indicate the stability and homogeneity of test chemical in the diet                 | Stability: Stability of the test material in feed was assessed in treated feed prepared at 313 and 5000 ppm from one day in the brooder during the test and from 14 days in the freezer. The brooder recoveries were 96-97% of the initial concentrations. The freezer recoveries were 93-99% of the initial concentrations.  Homogeneity: Homogeneity of the test material in feed was assessed in treated feed prepared at 313 and 5000 ppm.  Recoveries were 95-121% of the nominal concentrations. |   |
| Indicate if the test material was regurgitated                                      | No regurgitation was reported.   |   |
| Treatments on which necropsies were performed                                       | All surviving birds were necropsied.   | Several birds in the 605, 1275, 2657, and 5089 treatment groups had visible yolk stalk diverticulums; the author considered this a normal finding for mallards and it was not considered an adverse effect. |
| Observation intervals   | Mortality and signs of toxicity: Determined three times on Day 0 and daily (1 to 2 times) thereafter. Feed consumption: Determined daily Body Weight: Days -3, 0, 5, and 8   |   |
| Were raw data included?   | Yes  |   |

# **B. SUB-LETHAL TOXICITY ENDPOINTS:**

No treatment-related clinical signs of toxicity were observed during the study. There were no adverse effects on body weights or feed consumption during the exposure portion of the study. Significant reductions in body weight gain were detected in the 605, 1275, and 2657 mg a.i./kg diet treatment groups. Because these effects were not dose dependent, and because body weight at the end of the study did not differ among treatment groups the NOAEC based on body weights and feed consumption was determined to be ≥5089 mg a.i./kg diet.

No treatment-related findings were observed in postmortem examinations. Several birds in the 605, 1275, 2657, and 5089 treatment groups had visible yolk stalk diverticulums; the author considered this a normal finding for mallards and it was not considered an adverse effect.

# C. REPORTED STATISTICS:

The LC<sub>50</sub> could not be calculated because there were no mortalities. The bodyweight and growth data were analyzed using the chi-square test for normality and the Levene's test for homogeneity of variance. The body weight treatment group data were compared to the control using Dunnett's one-tailed test (p>0.05). The statistical analyses on body weight were conducted using the TOXSTAT version 3.4 computer program. The study authorreported NOAEC was 5089 mg a.i./kg feed. Mean measured concentrations were used in all estimations. Feed consumption data were not analyzed statistically.

# D. VERIFICATION OF STATISTICAL RESULTS:

Statistical Method: With the exception of the 605 mg ai/kg diet treatment group, body weight gain was higher in the treatment groups than in the control group during the exposure period; the reduction in the 605 mg ai/kg diet group was less than 1%. As a result, the toxicity values for body weight gain during the exposure period could be visually determined. Body weight gain during the recovery period was analyzed using ANOVA, followed by Dunnett's test, after confirming that data satisfied the assumptions of normality and homogeneity of variances; this analysis was conducted using Toxstat statistical software.

LC50:

>5089 mg ai/kg diet

95% C.I.: N/A

NOAEC: 5089 mg a.i./kg diet

Probit Slope: Not calculable

95% C.I.: N/A

# E. STUDY DEFICIENCIES:

There were no study deficiencies.

# F. REVIEWERS' COMMENTS:

Results of the reviewers' statistical verification and conclusions were similar to the study author's. Both the reviewers and study author detected significant reductions in body weight gain in the 605, 1275, and 2657 mg ai/kg diet treatment groups during the recovery period. The study author dismissed these substantial reductions in weight gain (68-88%) because they were not dose dependent. The observed reductions in body weight gain during the recovery phase coincided with a reduction in feed consumption at those treatment levels. It is possible that there was some food avoidance occurring at these middle doses, however it is unlikely to be treatment related as food consumption and growth were not affected during the actual exposure period. The reviewers therefore agree with the study author that the observed decrease in growth rate at the middle concentrations is not a biologically significant sublethal effect, and suggest that the NOAEC is 5089 mg a.i./kg diet.

## **G. CONCLUSIONS:**

This study is scientifically sound and is classified as ACCEPTABLE. The NOAEC was 5089 mg a.i./kg diet and the  $LC_{50}$  was >5089 mg a.i./kg diet, the highest treatment group, which categorizes pyrasulfotole as practically non-toxic to Mallard ducks on an acute dietary basis.

 $LC_{50}$ : >5089 mg ai/kg diet

95% C.I.: N/A

NOAEC: 5089 mg a.i./kg diet Endpoint(s) affected: None
